

Mirasvit Blog MX Manual

Getting Started

Welcome to the documentation of [Blog MX for Magento 2](#) extension.

Whether you are a new or an advanced user, you can find some useful information here.

First of all we recommend you check the following link:

- [How to install extension](#)

How to install the extension

Prepare for installation

1. Back up your store's database and web directory.
2. Log in to the SSH console of your server and navigate to the root directory of the Magento 2 store.
3. Copy the installation instructions from the page [My Downloadable Products](#) to the SSH console and press ENTER.

Install the extension via composer

1. Run command to enable the extension

```
php -f bin/magento module:enable Mirasvit_Core Mirasvit_BlogMx Mirasvit_Cor
```

2. Run command to install the extension

```
php -f bin/magento setup:upgrade
```

3. Run command to clean the Magento cache

```
php -f bin/magento cache:clean
```

4. Deploy static view files

```
rm -rf pub/static/*; rm -rf var/view_preprocessed/*;
php -f bin/magento setup:static-content:deploy
```

Install the extension for Hyva

1. Run the command to obtain the Blog MX Hyva component

```
composer require mirasvit/module-blog-mx-hyva:*
```

2. Enable installed Hyva component:

```
php -f bin/magento module:enable Hyva_MirasvitBlogMx Hyva_CompatModuleFallback
```

3. Update Magento database schema and data with the command:

```
php -f bin/magento setup:upgrade
```

4. Compile the code to generate the contents of Magento var/di folder:

```
php -f bin/magento setup:di:compile
```

5. Check the file app/etc/hyva-themes.json. If there are no entries for the package mirasvit/module-blog-mx-hyva package - run the following command

```
php -f bin/magento hyva:config:generate
```

6. Compile the code of the installed extension:

```
cd /path/to/theme/web/tailwind/
```

```
npm run build-prod
```

7. Deploy the static view files

```
cd /path/to/project/
```

```
rm -rf pub/static/*; rm -rf var/view_preprocessed/*;
php -f bin/magento setup:static-content:deploy
```

8. Run the command below to clean the cache:

```
php -f bin/magento cache:flush
```

Blog MX settings

The settings of Blog Mx are located at **Content ? Blog MX ? Settings** and are grouped into the following sections:

- [Appearance](#) - basic configuration of the blog appearance in the frontend.
- [Display](#) - additional configurations related to the blog appearance in the frontend.
- [Search Engine Optimization](#) - SEO settings of the module
- [Comments](#) - settings for comments in posts.
- [Sharing](#) - configurations for sharing blog posts via social networks, email, etc.
- [Layout Settings](#) - configurations related to the way pages of the blog will be displayed on the frontend.

Appearance

- **Top Menu Title** - set the title of the blog for the main menu.
- **Blog Name** - set the name of the blog that will be displayed on the main page of the blog and in the footer.
- **Date Format** - set the way the date will be displayed in the blog pages.

Example

- F j, Y - March 10, 2001
- Y-m-d - 2001-03-10
- D, M j, Y - Sat, Mar 10, 2001

[Read more](#) about accepted date format characters.

Display

- **Visible Navigation Menu** - if enabled, the link to the blog will be added to the main menu of the website.
- **Enable excerpts on list page** - When enabled, excerpts will be inserted as follows; if there is a tag in the post's content, the excerpt will go until that tag, next if the post has an excerpt that gets used, lastly, the first n characters of the post (as set below) will be displayed.
- **Default Excerpt Character size** - set the limit for the number of symbols of the post content to be displayed on the posts list pages.

Search Engine Optimization

- **Base URL** - the URL key for the blog (will be visible in the URLs for all blog pages).
- **Base Meta Title** - the part of the page meta title that will be added to all blog pages.
- **Base Meta Description** - the part of the meta description that will be added to all blog pages.
- **URL Suffix for Posts** - the suffix of the URLs for all blog post pages.
- **URL Suffix for Categories** - the suffix of the URLs for all blog category pages.

Comments

- **Provider** - choose the provider for comments or disable them. Currently our extension supports Mirasvit Comments and Facebook Comments.

Sharing

- **Enable AddToAny Sharing Buttons** - enable/disable AddToAny buttons.
- **AddToAny Sharing Buttons Code** - add the code for AddToAny buttons. You can customize buttons and get the code [here](#)

Layout Settings

- **Sort posts by** - choose the sorting for posts in all post list pages.
- **Posts per Page** - set options for post per page appearance (options for pager toolbar). Comma separated values. The default value is 10 , 20 , 50.
- **Layout Editor** - will redirect you to the [Layout Editor](#) to configure layouts of blog pages

Widgets

Since version 2.0.0 the whole frontend of the extension is based on Widgets.

The extension provides a bunch of Widgets of different types.

Each widget has the following configurations:

- **Template** - the template for rendering the widget. Different widget types have different sets of templates.

- **Frontend Title** - The text that can be displayed in the frontend as the title of the widget.

Most widget types are designed for configuring Blog pages.

The widget of the type **Posts** can be used on any page of the store.

Below is the information about different widget types provided by the extension:

- **Author** - the widget to display the author's bio. This widget has 2 templates available - Full and Short. Common places where this widget can be used are the Author page and the Post View page.
- **Category List** - the widget with category links (navigation) of the blog. This widget has only one template.
- **Newsletter** - the widget with standard email subscribe form. This widget has only one template.
- **Search Box** - the widget with the search bar to search through the blog. This widget has only one template.
- **Tag Cloud** - the widget to display tags configured in the blog. This widget has only one template.
- **RSS** - the widget with the link to the RSS feed of the blog. This widget has only one template.
- **Post List** - the widget to display the list of posts from the blog. The content of this widget depends on the page it was placed on. The Post List uses page context to display posts. If this blog is added to the category page it will display posts for that category. If this widget is placed on the search result page it will display posts that will match the search query.
- **Post View** - the widget to display the content of the post. It should be placed on the Post View page. On any other page type, this widget won't be displayed.
- **Post Comments** - the widget does display comments for each post. It should be placed on the Post View page. On any other page type, this widget won't be displayed.
- **Related Products** - The widget to display products related to the current post (added in the configurations of the post). This widget won't work outside the Post View page.
- **Posts** - This is the most complex widget provided by the extension. It can be placed on any page of the website. This widget has a few preinstalled templates. More information about them can be found in the [Posts Widget Templates](#) section. This widget, except the common settings **Template** and **Frontend Title**, has the following additional configurations:
 - **Limit** - the limit of the posts displayed in the widget. Some templates might not be affected by this setting
 - **Filter** - configure how the extension will choose posts to display. This setting can be affected by the page context if the **Use Page Context as Filter** is enabled. This setting has the following options:
 - **All posts** - display all posts.
 - **By tags** - display posts by selected tags or by tag from page context (Tag page)
 - **By categories** - display posts from selected categories or by the category from page context (Category page)
 - **By author** - display posts filtered by selected authors or by author from the page context (Author page, Post View page)
 - **Only pinned posts** - widget to display pinned posts.
 - **Only related posts** - widget to display related posts.
 - **Sorting Order** - select how posts should be ordered in the widget. This setting has the following options:
 - **By Creation Date**
 - **By Updating Date**
 - **By Name**
 - **By popularity**
 - **Use Page Context as Filter** - defines should the widget considers page context or not. For filters **All posts**, **Only pinned posts**, and **Only related posts** this option defines should posts in this widget be filtered depending on the page the widget is placed on or not

Example

The widget is set to display only pinned posts and placed on the category page. If the **Use Page Context as Filter** is enabled the widget will display pinned posts only from the current category. Otherwise, all pinned posts from all categories will be displayed in this widget.

For filters **By tags**, **By categories**, and **By author** this setting defines whenever the extension should use filter values from the widget configurations or from the page context

Example

The widget is set to filter posts by author and placed on the Author page. If the **Use Page Context as Filter** is enabled the widget will display posts by the current author. Otherwise, the widget will display posts by authors selected in the widget configurations.

Posts Widget Templates

The **Posts** widget is the widget that can be placed on any page of the store. This widget comes with a bunch of pre-installed templates with different designs:

- **Type 1** - single post widget (not affected by posts' limit configurations)

- **Type 2** - widget with one detailed post and a bunch of small posts listed in one column

Widgets' Customizations

Each widget provides one or a few different templates. Widget templates can be overridden in the theme as any other template.

Note

Templates organized in folders which are named correspondingly to the widget type -
`templates/widget/[widget_type]`

Each widget has access to templates only for its type.

The extension also supports custom templates for widgets.

Custom templates should be created in the same folder as if you overriding the original template but the name of the template file should differ from already defined templates.

In the case of a store with different themes for different store views, custom templates should be added to each active theme. If some theme does not have a template selected in the widget's configurations the extension will fall back to one of the default templates provided by the extension.

Related Posts on Product View pages

Since version 2.0.0 Related posts for products are no longer added automatically. To display related posts on Product View pages an additional widget of the type **Posts** should be created. The common configurations of such widgets are shown in the following images

WIDGET

- Storefront Properties
- Widget Options

Storefront Properties

Add Layout Update

WIDGET

- Storefront Properties
- Widget Options

Widget Options

Template: Type 7 (Vendor)

Frontend title: Related Posts

Limit: 6

Filter: Only related post

Sorting Order: By Creation Date

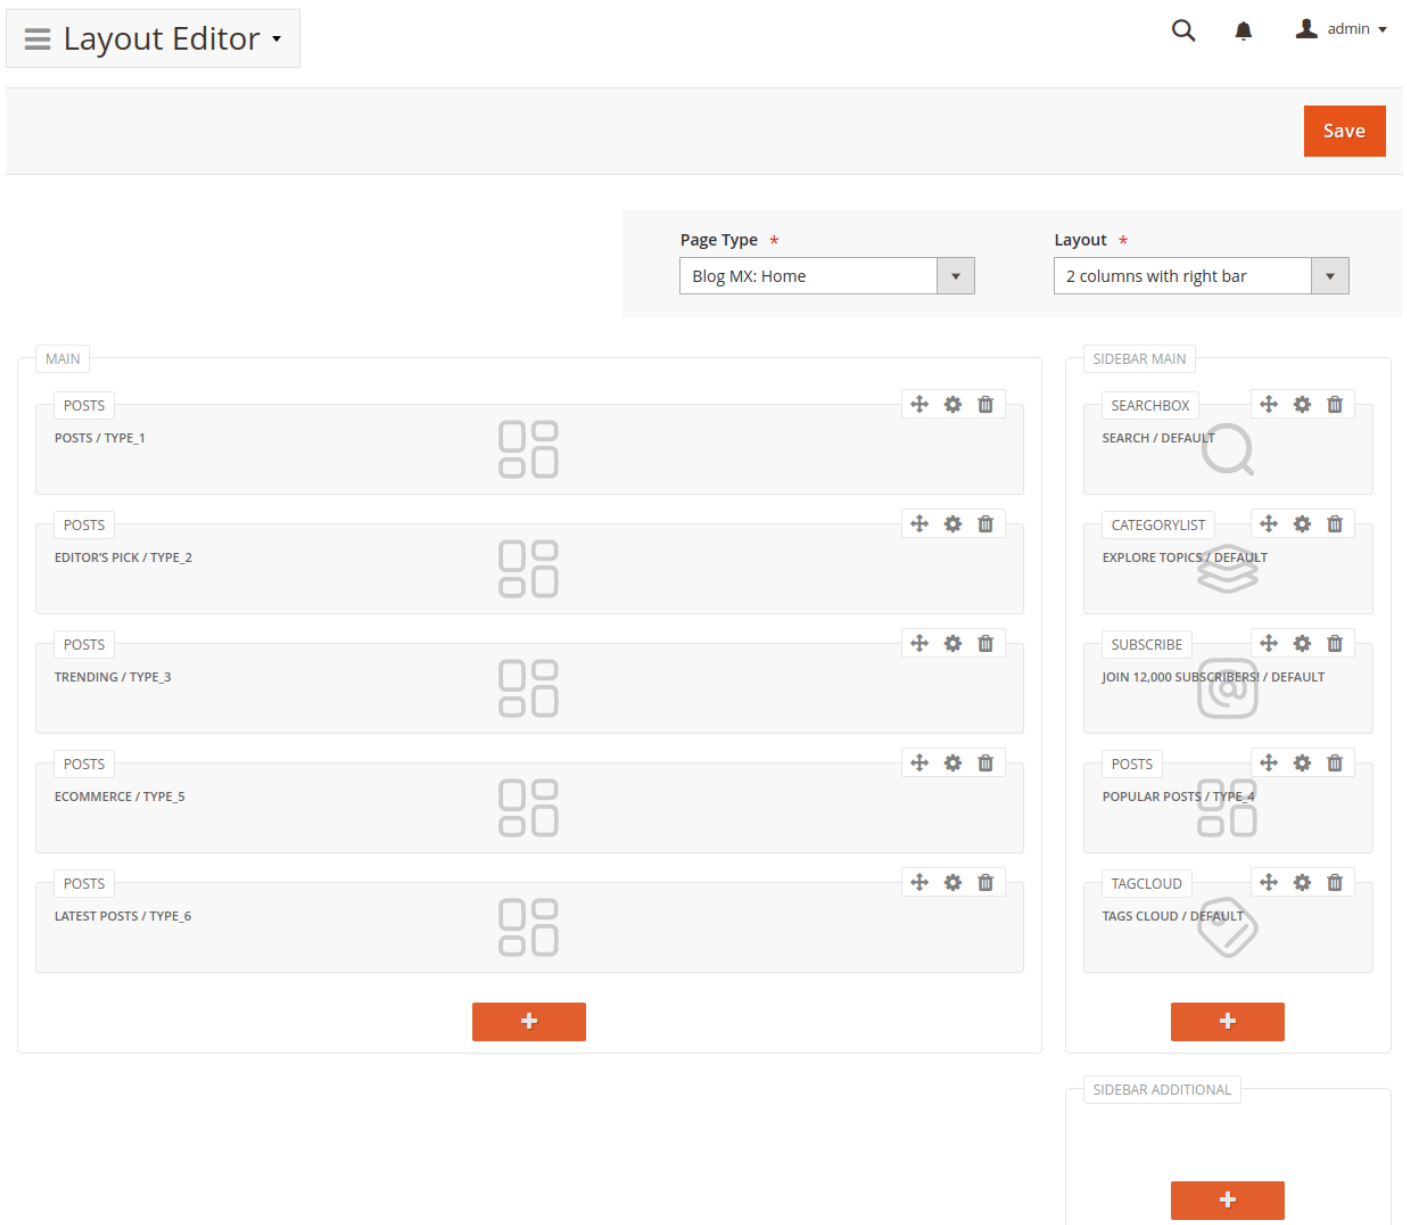

Use Page Context as Filter: Yes

Note
For the store with multiple store views and themes the widget for related posts should be created for each active theme

Layout Editor

The extension provides the ability to configure the layout for every page type of the extension separately. Go to the **Content** -> **Blog MX by Mirasvit** -> **Layout Editor** or click the **Layout Editor** button in the **Layout Settings** section of the extension's configurations to open the Layout Editor.

The extension has preconfigured layouts for each page type. You can use preconfigured layouts or adjust them according to your needs.

The Layout Editor interface has 2 sections.

The first section has 2 configuration fields of general settings:

- **Page Type** - select the page type for which the layout will be configured. Layout settings should be saved before changing the page type. Otherwise, all unsaved configurations will be lost after changing the page type.

- **Layout** - select the layout mode for the current page type. Available layout modes are *1 column*, *2 columns with left bar*, *2 columns with right bar*, and *3 columns*.

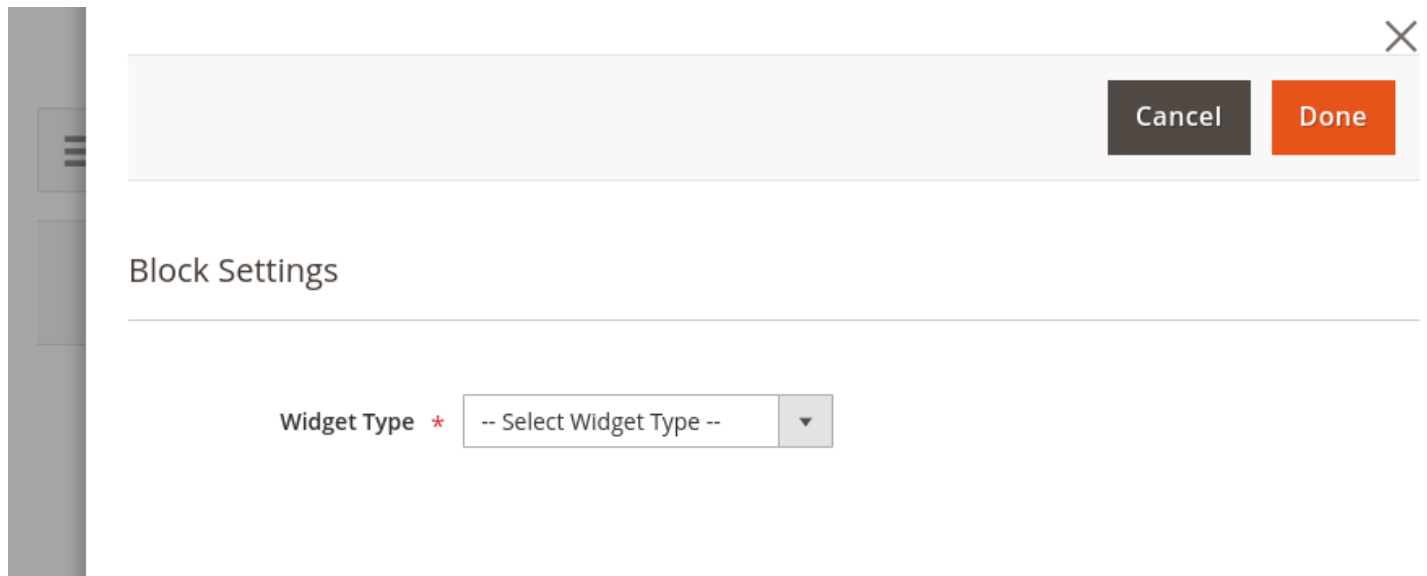

The second section is the Layout Editor itself. It contains 3 containers where different blocks (widgets) can be placed.

The position of those containers depends on the layout selected in the first section.

To add a new block (widget) click the + button at the bottom of the container in which the block should be inserted. After clicking this button a new block will be inserted at the bottom of the corresponding container.

To configure the newly added or existing block click on the gear icon (edit button) in the top right corner of the block. After clicking on this button the modal will be open with configurations of the block.

For a newly created block, the modal will contain only one configuration field - **Widget Type**. After selecting the type of the widget the configurations related to this widget type will be displayed. More information about configurations for different blocks can be found in the [Widgets](#) section of this manual.

To change the position of the block click and hold on the arrows icon, move the block to the place where it should be placed, and drop the widget there.

Save

Page Type *
 Blog MX: Home ▾

Layout *
 2 columns with right bar ▾

To delete the block click on the thrash bin icon (delete button) in the top right corner of the block.

After the layout for the page is configured press the **Save** button to save the layout configurations for the current page type.

No changes will be applied to the layout configurations of the page until the configurations are saved.

Clean the cache of your Magento store after the layout for blog pages is configured and saved.

Handle theme changes

When the layout for any blog page is saved the extension generates widgets for each block for all **active** themes in the store.

If the theme for any store view is changed to previously inactive or a new theme the command `bin/magento mirasvit:blog:update-layout` should be executed. The execution of this command will update widgets for all active themes in the store so blog pages will have proper content for each storeview.

General Configurations

All configurations of the **Comments** extension are located at **Stores -> Configuration -> Mirasvit Extensions -> Comments**.

The extension has only one configurations section - **General Settings** - with the following configurations:

- **Enable Comments** - enable/disable the comments feature.
- **Allow Guests to Write Comments** - defines whether guest users are allowed to leave comments or not.
- **Automatically Approve Comments** - defines whether comments left by visitors should automatically obtain the **Approved** status or should be left for moderation.
- **Date Format** - defines how the date when the comment was left should be displayed.
- **Enable Admin Notifications** - if enabled, the extension will add notifications about pending comments into the admin system notifications.

General Configurations

All configurations of the **Comments** extension are located at **Stores -> Configuration -> Mirasvit Extensions -> Comments**.

The extension has only one configurations section - **General Settings** - with the following configurations:

- **Enable Comments** - enable/disable the comments feature.
- **Allow Guests to Write Comments** - defines whether guest users are allowed to leave comments or not.
- **Automatically Approve Comments** - defines whether comments left by visitors should automatically obtain the **Approved** status or should be left for moderation.
- **Date Format** - defines how the date when the comment was left should be displayed.
- **Enable Admin Notifications** - if enabled, the extension will add notifications about pending comments into the admin system notifications.

How to upgrade extension

To upgrade the extension, follow these steps:

1. Backup your store's database and web directory.
2. Login to your server's SSH console and navigate to the root directory of the Magento 2 store.
3. Run command `composer require mirasvit/module-blog-mx:* --update-with-dependencies` to update current extension with all dependencies.

Note

There are some cases when the command above is not applicable; it is not possible when updating the current module; neither will it be applicable when upgrading all the Mirasvit modules in a bundle. In this case, the command above will be of no effect.

Run instead `composer update mirasvit/*` command. It will update all Mirasvit modules installed in your store.

4. Run command `php -f bin/magento module:enable Mirasvit_Core Mirasvit_BlogMx Mirasvit_Comment` to enable the extension.
5. Run command `php -f bin/magento setup:upgrade` to install updates.
6. Run command `php -f bin/magento cache:clean` to clean the cache.

7. Deploy static view files

```
rm -rf pub/static/*; rm -rf var/view_preprocessed/*; php -f  
bin/magento setup:static-content:deploy
```

Note

If you have the Hyva installed, run:

```
composer require mirasvit/module-blog-mx:* mirasvit/module-blog-mx-hyva:* --up
```

Disabling the Extension

Temporarily Disable

To temporarily disable the extension please follow these steps:

1. Login to your server's SSH console and navigate to the root directory of the Magento 2 store.
2. Run command `php -f bin/magento module:disable Mirasvit_BlogMx Mirasvit_Comment` to disable the extension.
3. Log in to the Magento backend and refresh the store cache (if enabled).

Note

If you have Hyva installed, run:

```
php -f bin/magento module:disable Mirasvit_BlogMx Mirasvit_Comment Hyva_Mirasvit
```

Removing the Extension

To uninstall the extension, please follow these steps:

1. Login to your server's SSH console and navigate to the root directory of the Magento 2 store.
2. Run the command `composer remove mirasvit/module-blog-mx` to remove the extension.
3. Log in to the Magento backend and refresh the store's cache (if enabled).

Note

If you have Hyva installed, run:

```
composer remove mirasvit/module-blog-mx:* mirasvit/module-blog-mx-hyva:*
```
